08

Recommendations

5 specific actions your team can take this week

The Business Problem

Pricing decisions on Amazon are made blindly — with huge financial consequences.

Gut-Feel Pricing

Most sellers set prices based on intuition, not data. Too low → lost profit. Too high → lost customers. There's no system to find the sweet spot.

Competitor Blind Spots

When a competitor drops prices, you're the last to know. By the time you react, you've already lost sales — especially during festive season.

Missed Festive Revenue

October & November are 3× more valuable than other months. Without a pricing system, sellers under-price during peak demand and leave money on the table.

PriceOracle solves this: Predict Demand → Simulate Prices → Optimise Profit → Explain with AI

5.4

Avg demand · Jan–Aug

Sep–Nov

Prime Festive Window

RECOMMENDATION: Raise prices by 10–15% in October & November when demand peaks — customers are less price-sensitive during festive season.

Competitor & Pricing Analysis

Feature Correlation Matrix

What the Data Tells Us

Price ↔ Demand **-0.78**

Higher price = lower sales

Price ↔ Cost **+0.99**

Cost drives price — logical

Price ↔ Competitor **+0.97**

Prices move together

Festive ↔ Demand **+0.70**

Festive season boosts sales

Revenue ↔ Profit **+0.94**

More sales = more profit

Avg Competitor Price: ₹991 · Avg Our Price: ₹973 · We are ₹18 cheaper on average — room to raise prices!

AI Model Performance

We trained 3 machine learning models to predict how many units sell at each price. Results:

Winner

Gradient Boosting

R² Score: **0.978** 97.8% accuracy
MAE: **0.511** Off by < 1 unit
MAPE: **10.7%** Error rate

Predicted vs Actual Demand — Gradient Boosting

In plain English: The model correctly predicts how many units will sell at any given price — even before you launch!

What Drives Demand? Top Factors

What This Means for You

#1

Price (84%)

The price you set is by far the biggest driver of how much you sell.

#2

Price Tier (7%)

Whether you're Budget, Mid-range or Premium affects buyer behaviour.

#3

Category (5%)

Kurtas and Sets behave very differently from Blouses & Skirts.

#4

Festive Season (1%)

October–November boosts demand noticeably — even at higher prices.

🔥 Price is your #1 lever — use it strategically.

The Price Optimization Engine

Real example: A Kurta priced at ₹799 — should the price stay, go up, or come down?

How It Works (4 Steps)

1

You Enter Inputs

Price, cost, competitor price, region, category, date

2

AI Predicts Demand

The model forecasts units sold at 60 different price points

3

Profit is Calculated

$(\text{Price} - \text{Cost}) \times \text{Demand}$ for every scenario

4

Best Price Revealed

The price with highest profit is shown instantly

5 Recommendations for Your Business

Concrete actions based on 113,815 orders of Amazon India data

01

Raise Prices 10–15% in Oct–Nov

HIGH IMPACT

Festive demand is 3× normal. Customers are less price-sensitive. A ₹599 Kurta can become ₹699 without losing volume.

02

Fix Underpriced Products

QUICK WIN

Our average price (₹973) is ₹18 below competitors (₹991). For Kurtas & Sets you can safely raise by 5–10% to recapture margin.

03

Premium Pricing for Western Dress

MARGIN
PROTECT

Western Dress has the highest avg price (₹1,545) and strong demand. Do not discount this category — full price protects premium positioning.

04

Regional Price Differentiation

GROWTH

Maharashtra & Karnataka drive 27% of revenue. Consider metro-premium pricing (₹50–100 higher) in top-5 regions — purchasing power is higher.

05

Use PriceOracle Before Every Reprice

SYSTEMATIC

Before changing any price, run it through the optimizer. It takes 30 seconds and shows expected profit impact instantly — no guesswork.
